Question: 2

DRAG DROP

A manager calls upon a tester to assist with diagnosing an issue within the following Python script:

```
#!/usr/bin/python
```

```
s = "Administrator"
```

The tester suspects it is an issue with string slicing and manipulation. Analyze the following code segment and drag and drop the correct output for each string manipulation to its corresponding code segment.

Options may be used once or not at all.

Code segment	Output		
<code>s[4:8]</code>	<input type="text"/>	iita	imda
<code>s[4:12:2]</code>	<input type="text"/>	inis	nist
<code>s[3::-1]</code>	<input type="text"/>	nsrt	rota
<code>s[-7:-2]</code>	<input type="text"/>	snmA	trat

Answer:

Code segment	Output
<code>s[4:8]</code>	nsrt
<code>s[4:12:2]</code>	snmA
<code>s[3::-1]</code>	trat
<code>s[-7:-2]</code>	imda

Instructions:

Given the following attack signatures, determine the attack type, and then identify the associated remediation to prevent the attack in the future.

If at any time you would like to bring back the initial state of the simulation, please click the Reset All button.

You are a security analyst tasked with hardening a web server.

You have been given a list of HTTP payloads that were flagged as malicious.

Question: 5

DRAG DROP

Instructions:

Analyze the code segments to determine which sections are needed to complete a port scanning script. Drag the appropriate elements into the correct locations to complete the script.

If at any time you would like to bring back the initial state of the simulation, please click the reset all button.

During a penetration test, you gain access to a system with a limited user interface. This machine appears to have access to an isolated network that you would like to port scan.

```
