## Question: 1

Which is not a service type in Kubernetes?

A. ClusterIP
B. NodePort
C. Ingress
D. LoadBalancer
E. ExternalName

**Answer: C**

Explanation:
https://kubernetes.io/docs/tutorials/kubernetes-basics/expose/expose-intro/

without a Service. Services allow your applications to receive traffic. Services can be exposed in different ways by specifying a `type` in the ServiceSpec:

- *ClusterIP* (default) - Exposes the Service on an internal IP in the cluster. This type makes the Service only reachable from within the cluster.
- *NodePort* - Exposes the Service on the same port of each selected Node in the cluster using NAT. Makes a Service accessible from outside the cluster using `<NodeIP>:<NodePort>`. Superset of ClusterIP.
- *LoadBalancer* - Creates an external load balancer in the current cloud (if supported) and assigns a fixed, external IP to the Service. Superset of NodePort.
- *ExternalName* - Maps the Service to the contents of the `externalName` field (e.g. `foo.bar.example.com`), by returning a `CNAME` record with its value. No proxying of any kind is set up. This type requires v1.7 or higher of `kube-dns`, or CoreDNS version 0.0.8 or higher.

More information about the different types of Services can be found in the Using Source IP tutorial. Also see Connecting Applications with Services.

## Question: 2

What standard does kubelet use to communicate with the container runtime?

A. Service Mesh Interface (SMI)
B. CRI-O

C. ContainerD
D. Container Runtime Interface (CRI)

| Answer: D |
|---|

Explanation:
kubelet can communicate with any runtime that supports the CRI standard.

## Question: 3

What kind of limitation cgroups allows?

A. Prioritization
B. Resource limiting
C. Accounting
D. None of the options
E. Control
F. Server cpu and memory

| Answer: A, B, C, E |
|---|

## Question: 4

What is the most common way to scale the application in the cloud environment?

A. Parallel Scaling
B. Horizontal Scaling
C. Vertical Scaling

| Answer: B |
|---|

Explanation:
https://kubernetes.io/docs/tasks/run-application/horizontal-pod-autoscale/

## Question: 5

Which of the following is an advantage a cloud-native microservices application has over monolithic applications?

A. Cloud-native microservices applications tend to be faster and more responsive than monolithic applications.
B. Cloud-native microservice applications tend to be easier to troubleshoot.

C. Cloud-native microservice applications tend to be easier to scale and perform updates on.

**Answer: C**

Explanation:
Cloud-native applications tend to be microservice base, they have individual services that can be independently scaled, updated and rolled back. This makes scaling and update operations simpler and less risky.
